

Jordan Lee

Senior Software Engineer | Backend & Platform Systems

Tel Aviv, Israel · +972 50 555 0142 · jordan.lee@example.com · linkedin.com/in/jordanlee · github.com/jordanlee

SUMMARY

Senior software engineer with 11+ years building backend, platform, and cybersecurity products across cloud and distributed systems. Leads architecture from high-level design through delivery, translating product requirements into reliable services and data models. Known for cross-team technical direction, mentoring engineers, and improving performance, operational resilience, and delivery speed.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, SQL, Python

Backend: Node.js, NestJS, REST APIs, Kafka, Microservices

Data: PostgreSQL, ClickHouse, Redis, TypeORM, Data modeling

Cloud & Infrastructure: AWS, Docker, Kubernetes, CI/CD, Observability

Architecture: Distributed systems, Event-driven systems, System design, Cybersecurity products

EXPERIENCE

Northstar Security

Senior Software Engineer — Tel Aviv, Israel | Jul 2021–Present

- Designed and led a backend-controlled configuration architecture for heterogeneous AI assets, enabling new asset types to reuse shared page and card infrastructure with minimal frontend changes.
- Owned high-level design and delivery of an event-driven ingestion platform processing more than 40 million security events per day across Kafka, Node.js, PostgreSQL, and ClickHouse.
- Redesigned query paths and data models for a high-volume investigation workflow, reducing p95 response time by 63% while preserving tenant isolation and auditability.
- Coordinated delivery across backend, frontend, product, architecture, and UI/UX partners, turning ambiguous requirements into sequenced technical milestones for a strategic product launch.
- Mentored six engineers through design reviews, onboarding, and incident follow-ups, establishing reusable patterns for observability, testing, and operational ownership.

Example Cloud Systems

Software Engineer — Remote | Jan 2017–Jun 2021

- Built multi-tenant backend services in TypeScript and NestJS that supported more than 200 enterprise customers and sustained 99.95% availability.
- Led migration of synchronous workflows to event-driven processing, improving failure isolation and cutting peak request latency by 45%.
- Introduced automated deployment checks, service-level dashboards, and structured incident reviews, reducing repeat production incidents by 30%.

Sample Digital

Full-Stack Developer — Haifa, Israel | Jul 2013–Dec 2016

- Delivered customer-facing web applications and Node.js APIs from discovery through production, with ownership spanning data modeling, testing, and deployment.
- Created shared application components and engineering documentation that shortened onboarding and reduced duplicated implementation across three product teams.

SELECTED ENGINEERING HIGHLIGHTS

- Created an open-source TypeScript toolkit for validating event schemas and generating typed consumers, adopted by multiple engineering teams and used in production services.
- Designed a reference architecture for secure AI-assisted workflows on AWS, covering model access, data boundaries, audit events, and failure handling.

EDUCATION

Example University

B.Sc. in Computer Science | 2009–2013

CERTIFICATIONS

AWS: Certified Solutions Architect – Associate, 2024
Security: Cloud Security Professional Certification, 2023

ADDITIONAL INFORMATION

Languages: Hebrew (native), English (professional)
Community: Volunteer mentor for early-career software engineers
